## wireless delivery

*Automate your metered delivery trucks with onboard wireless*

Solve the unique challenges of managing your petroleum delivery supply chain with AWD Automated Wireless Delivery.

Streamline your delivery operation. The AWD Wireless Delivery application is a reliable and secure real time wireless data collection system designed using Windows, Windows Mobile and Microsoft's SQL Server. AWD will allow you to effectively monitor and control your delivery fleet. A proven tool, designed exclusively for the petroleum distribution industry. The AWD application makes it possible to meet the changing demands of your customers. For over 18 years, large and small petroleum distributors across the United States and Canada have been realizing huge increases in profit and efficiency with our established wireless solutions. The AWD application seamlessly integrates with our E-System Enterprise Management software or can be integrated to your existing back office software.

### Track Deliveries & Transactions

Over 75% reduction in back office clerical requirements.

- **Point of Sale paperless invoicing** with onboard printing allows **Drivers** to leave detailed invoices with customers and the transaction data is immediately transmitted back to your office accounts receivable system. This important feature greatly reduces the billing cycle and eliminates data entry errors. The system completely eliminates printing tickets, losing tickets,

bursting tickets, posting tickets as well as postage, envelopes and stuffing envelopes saving you time and money!

### Stay Connected in real time to Drivers, Trucks and Tickets.

Use the AWD application to make changes on the fly.

- **Make changes from your desk.** The AWD application offers managers and dispatchers the ease, security and accuracy of managing their petroleum distribution supply chain with real-time wireless connectivity to onboard touch screen computers and electronic metering registers.

**AWD Fixed Mount CV30**

Dispatchers can immediately connect to any or all of the onboard computers (shown above) to update any ticket, add or delete tickets, pullback tickets, add new instructions, add or change a preset to a specific volume or dollar amount and can even change pricing globally or

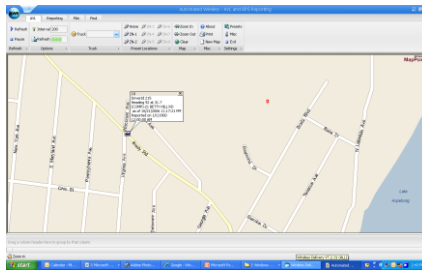

on a single ticket. Inventory levels are available at all times on the Control Center Dashboard. Dispatchers can also communicate with drivers anytime with two way chat.

- **Delivery information in one place.** Dispatch has all activity related to deliveries in one place. All information such as: Product, Taxing, Degree Day Info and Scheduling. All account information is visible in AWD from the back office. This enables dispatchers to make decisions with information at hand instead of having to dig into the back office software for more information.
- **No headache design.** The AWD control center and mobile application is well organized with clean display screens that are not crowded. Views can be customized to the preference of the dispatcher or driver. AWD is a powerful tool that will drive business efficiency and productivity for years to come.
- **Powerful reporting.** The integrated AWD Active Reports gives users the ability to run up to 30 reports. From end of day shift detail by truck, inventory detail, load report, tax reports to key performance indicator stats with the wireless delivery report which breaks down your driver's stats. With full integration to Microsoft products in seconds you can have any of these reports exported to PDF, Word or Excel for further formatting and analysis.

## Connect to Customers

Use the AWD to track and manage your accounts, and sales.

- **Customer satisfaction.** Your customers can be told what truck and driver is in the vicinity to make a delivery. Through our AVL/GPS dispatchers can tell customers what drivers are in the area and determine how much fuel is on board in real time. Your customers can even be told that the driver has enough fuel to get them filled up in the next hour with the "inventory view" dispatchers can see available onboard inventory in real time. Now that creates customer loyalty.

## Advanced Scheduling creates more profit with fewer deliveries

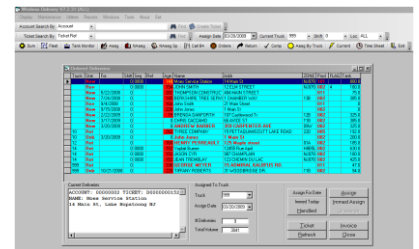

Huge increases in gallons delivered per hour.

- **Reduce costs.** With over 35 years experience as a degree day software company you can rest assured the AWD application will work hand in hand with our E-system Advanced Scheduling degree day module or your existing degree day software. Ticket pulls can come down flagged to the AWD Control Center as scheduled, call before, ordered

date or difficult to reach.

Dispatchers have the ideal volume to be delivered so they can deliver and load efficiently. All deliveries are tagged upon delivery completion as a full/not full. This data can be shared with your degree day software for further manipulation of degree day numbers and k-factors.

The tools built into the AWD application are guaranteed to decrease your number of deliveries and save you money.

Use the AWD Control Center to schedule and organize routes to increase profit and reduce deliveries.

*"For just the month of January using the E-system Advanced Scheduling Module and the AWD Wireless Delivery System we were able to deliver 150,000 more gallons, we had 1200 less deliveries and we averaged about 50 gallons more per stop."*

*Paul Rzeszutarski, Energy Division Manager  
Western Reserve Farm Cooperative*

*This data was compared to the January a year prior using a competing Back Office Software and wireless system.*
